## What is Gophish?

Gophish is a phishing framework that makes the simulation of real-world phishing attacks dead-simple. The idea behind gophish is simple – make industry-grade phishing training available to *everyone*.

“Available” in this case means two things –

- **Affordable** – Gophish is currently open-source software that is completely free for anyone to use.
- **Accessible** – Gophish is written in the Go programming language. This has the benefit that gophish releases are compiled binaries with no dependencies. In a nutshell, this makes installation as simple as “download and run”!

## Version

This User Guide is for gophish “community edition” version 0.1.

## License

### Community Edition

## Key Terms

The following key terms will be used in this document:

- Campaign – A single set of emails (built with templates) sent to one or more groups of users
- User – A single target of phishing campaigns
- Group – A group of Users
- Template – An email template (subject, body, attachments, etc.) to be used in Campaigns
- Landing Page – HTML that is presented when a user clicks the phishing link

## Setup

### Installation

#### Installing Gophish Using Pre-Built Binaries

Gophish is provided as a pre-built binary for most operating systems. With this being the case, installation is as simple as downloading the ZIP file containing the binary that is built for your OS and extracting the contents.

#### Installing Gophish from Source

One of the major benefits of having written gophish in the Go programming language is that it is extremely simple to build from source. All you will need is the Go language and a C compiler (such as gcc).

To install gophish, simply run `go get github.com/gophish/gophish`. This downloads gophish into your `$GOPATH`.

Next, navigate to `$GOPATH/src/github.com/gophish/gophish` and run the command `go build`. This builds a gophish binary in the current directory.

### Running Gophish

Now that you have gophish installed, you're ready to run the software. To launch gophish, simply open a command shell and navigate to the directory the gophish binary is located.

Then, execute the gophish binary. You will see some informational output showing both the admin and phishing web servers starting up, as well as the database being created. This output will tell you the port numbers you can use to connect to the web interfaces.

```
gophish@gophish.dev:~/src/github.com/gophish/gophish$ ./gophish
2016/01/10 23:13:42 worker.go:34: Background Worker Started Successfully - Waiting
for Campaigns
2016/01/10 23:13:42 models.go:64: Database not found... creating db at gophish.db
2016/01/10 23:13:42 gophish.go:49: Admin server started at http://127.0.0.1:3333
2016/01/10 23:13:42 gophish.go:51: Phishing server started at http://0.0.0.0:80
```

## Managing Users

Gophish allows you to create and manage multiple user accounts, each with their own templates, campaigns, groups, etc. Here are some common actions on how to manage these accounts:

---

### **DANGER:**

*When you first launch gophish, you should immediately change the admin password,  
as the default is clearly published!*

---

### Changing Your Password

To change your password, first login to gophish. Then, navigate to "Settings":

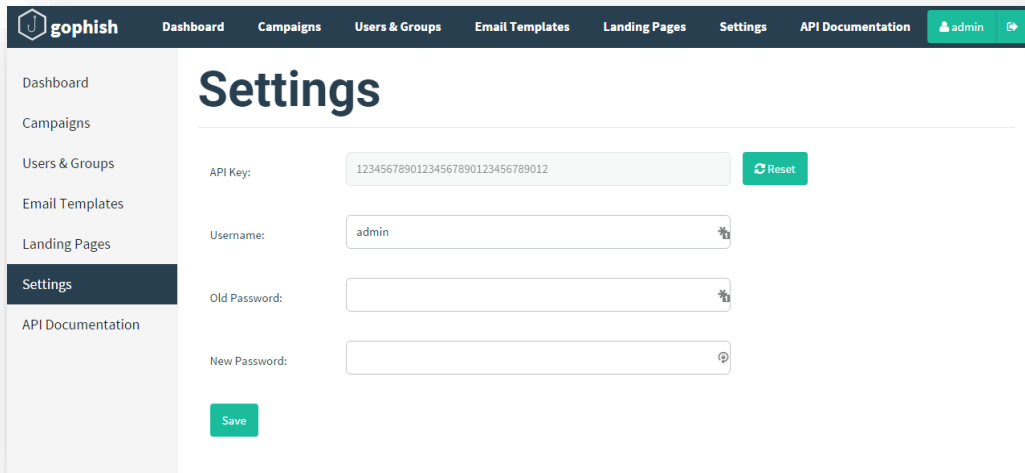

Figure 1 - Settings Page

From here, you can change your password by filling out the field “Old Password” with your current password and by filling out the field “New Password” with the password you want to set.

When you click “Save”, you should see a confirmation message that your password has been changed.

### Changing Your API Key

If you ever need to change your API key, you can do so from the “Settings” page. After clicking the “Reset” button, you will see a confirmation message that the reset was successful:

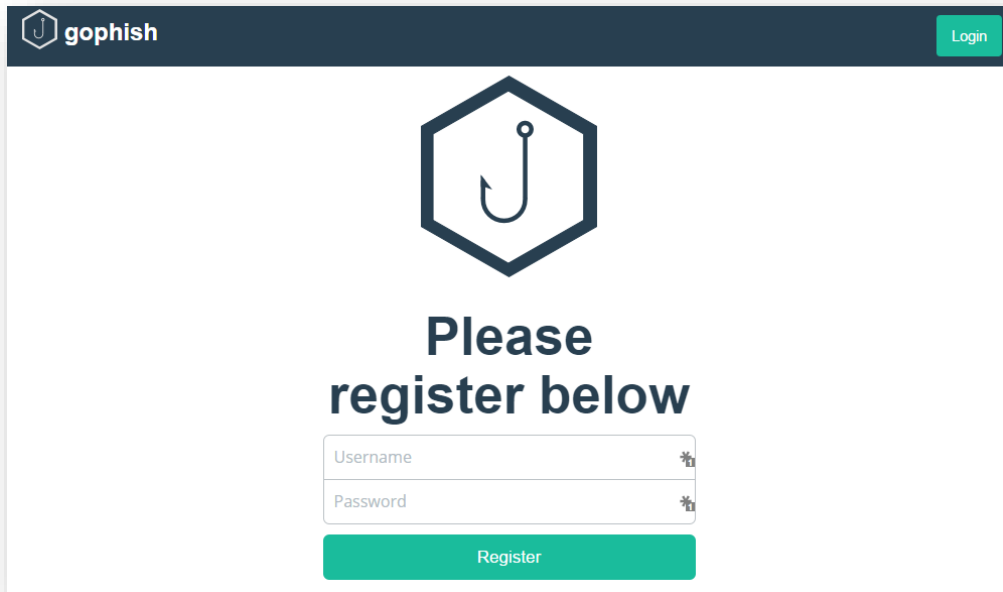

Figure 2 - Resetting API Key

## Registering a New Account

By default, only the admin account is registered. To register a new account, navigate to [http://\[gophish\]/register](http://[gophish]/register).

On this page, you can create a new username/password.

*Figure 3 - Registering a New Account*

After creating this account, you will be taken to the login page, where you can login using your credentials.

Now let's setup a campaign!

## Introducing Morning Catch Corporation

For this documentation, we will step through the process of setting up users, templates, and a full campaign from scratch for a fake company called Morning Catch. In this case, we are assuming the role of a security administrator of Morning Catch and have been given the authorization to perform this training.

As a note, this fake company is based on a great VM used specifically for testing phishing frameworks that you can download [here](#) if you're interested.

The fake company will consist of 3 users: Richard Bourne, Boyd Jenius, and Haiti Moreo.

## How to Setup a Campaign from Scratch

Now that we have adjusted the settings to our liking, let's run a campaign! There are a minimum of three steps you need to launch a phishing campaign from gophish:

1. Create the list of users to be targeted

2. Create the email template (the “phish”)
3. Create and execute the actual campaign

Let’s show each step in detail to see how we can run a campaign against the employees of Morning Catch.

## Creating Users & Groups

The first thing we need to do before we can launch a campaign is to figure out who to target. There are a *ton* of ways to gather/generate email addresses for potential targets. You can either harvest email addresses from public information using OSINT if you are aiming to simulate a realistic scenario.

Now that we have our list of users, let’s import them into gophish.

To add a group, navigate to the “Users & Groups” page and click “New Group”:

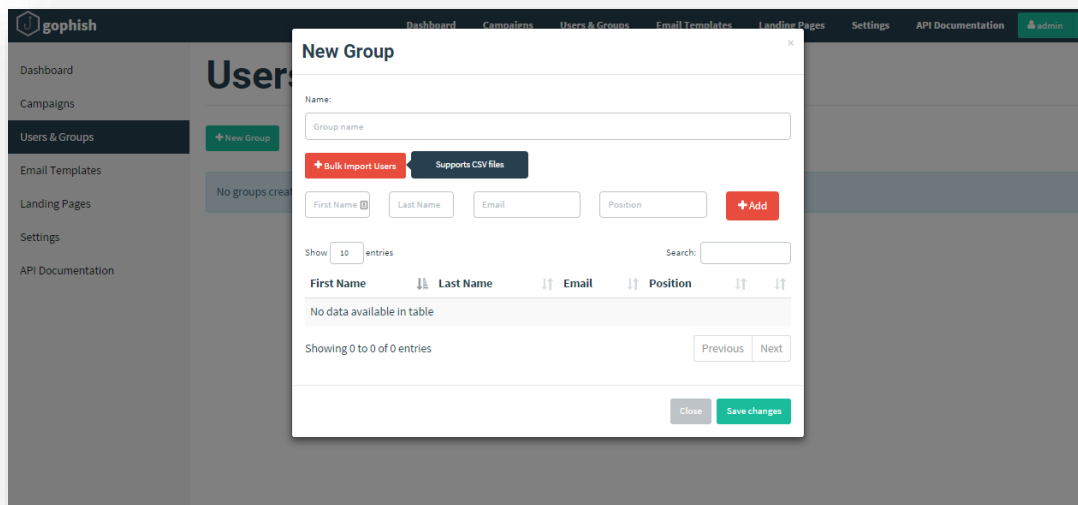

Figure 4 - Creating a Group

Since we are performing phishing simulation for Morning Catch, we can call our group “Morning Catch Employees”.

Now we have to add the members. There are two ways to do this:

- Add each member’s details one at a time using the form inputs
- Bulk import the group from a CSV file

To save time (and typing!) let’s go with the CSV option.

The CSV format gophish expects has the following header values:

- First Name
- Last Name
- Email
- Position

So, the CSV for Morning Catch would look like the following:

```
First Name, Last Name, Position, Email, Company
Richard, Bourne, CEO, rbourne@morningcatch.ph, Morning Catch
Boyd, Jenius, Systems Administrator, bjenius@morningcatch.ph, Morning Catch
Haiti, Moreo, Sales & Marketing, hmoreo@morningcatch.ph, Morning Catch
```

Figure 5 - Morning Catch Employees CSV

After uploading this CSV using the “Bulk Import Users” button, we see that our members were added automatically:

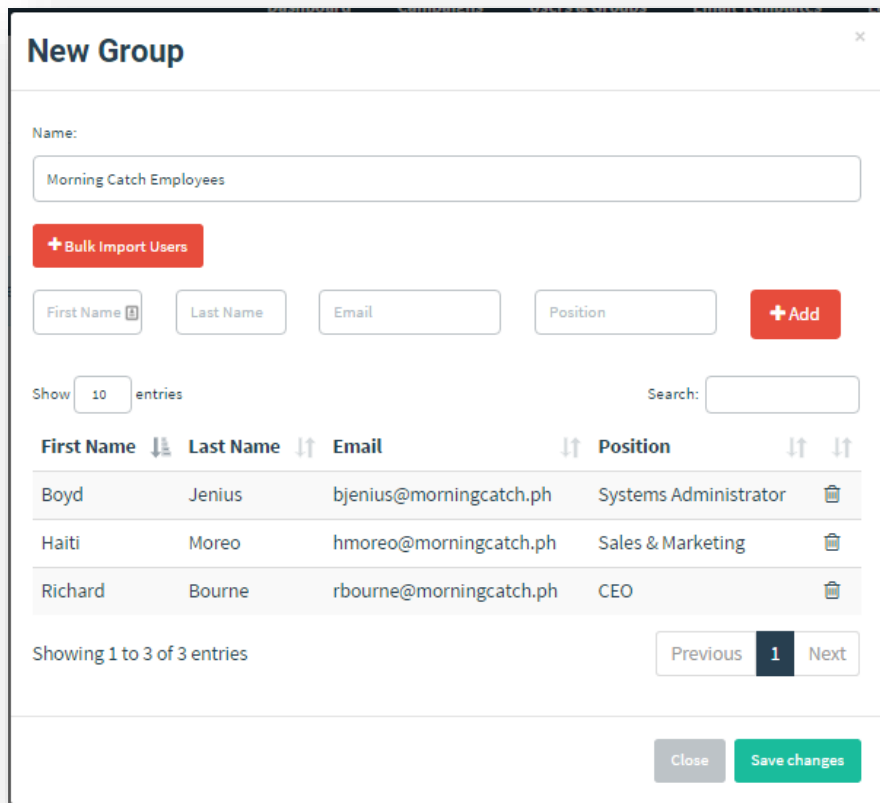

Figure 6 - Importing Users from CSV

After clicking “Save changes”, we see a confirmation message that our group was created.

---

*Tip:*

---

---

*If you don't see the group show up right away, refresh the page and it should appear in the table.*

---

## Creating Templates

A “Template” is the content of the emails that are sent to targets. They can be imported from an existing email, or created from scratch. Additionally, templates can contain tracking images so that gophish knows when the user opens the email.

To create a template, first navigate to the “Email Templates” page and click the “New Template” button.

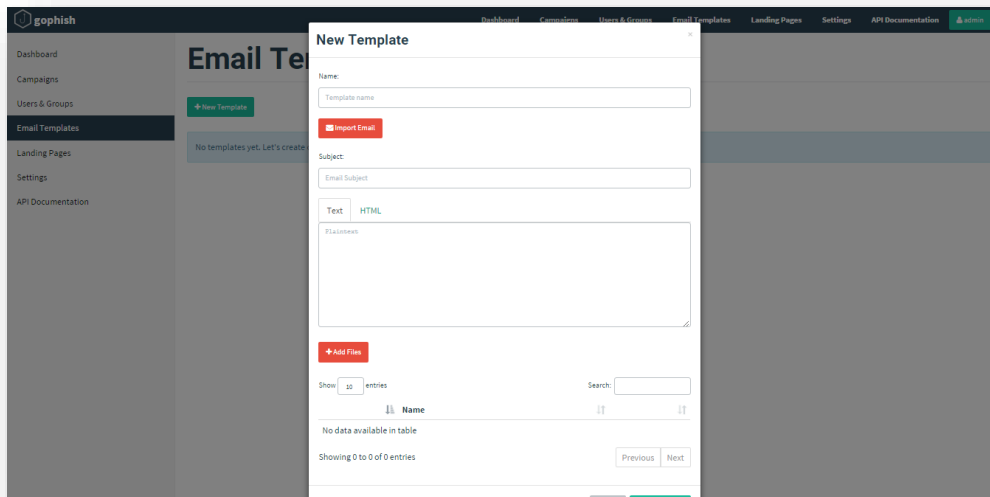

Figure 7 - Template Creation Page

For our example, let's create a template from scratch to send to the employees of Morning Catch.

We notice that Morning Catch comes with a webmail portal. Let's craft a simple template that suggests the user needs to go reset their password. Obviously, this is a simple scenario, and by using the “Import Email” feature, you can import existing emails directly into gophish for a greater effect.

By clicking the “HTML” tab, we will see the editor we can use to create our HTML content:

Figure 8 - HTML Editor

Since our content is pretty simple, we can just click the “Source” button and be taken to the more visual editor, which will be enough for our purposes:

Figure 9 - Visual HTML Editor

For now, we will include the following text in the HTML portion of the email:

```
"Dear {{.FirstName}}
```

```
Records have indicated that your webmail password may have been compromised  
in a recent data loss incident. As soon as possible, please reset your  
webmail password using this link.
```

```
Regards,
```

```
{{.From}}
```

{{.Tracker}}"

Wait – what are those “{{.FirstName}}” things? These are **template variables**. This is part of a very powerful feature of gophish that allows us to tailor the emails and landing pages users see to their specific details. For example, a user named “John Doe” might see “Dear John” when he receives the email. You can find a full listing of the supported template variables in the Appendix.

**The {{.Tracker}} variable is especially important.** This adds a 1x1 image that is used to track if the user opens the email. Without this, you will not be able to know if the user opened the email unless they click the link to your {{.URL}}.

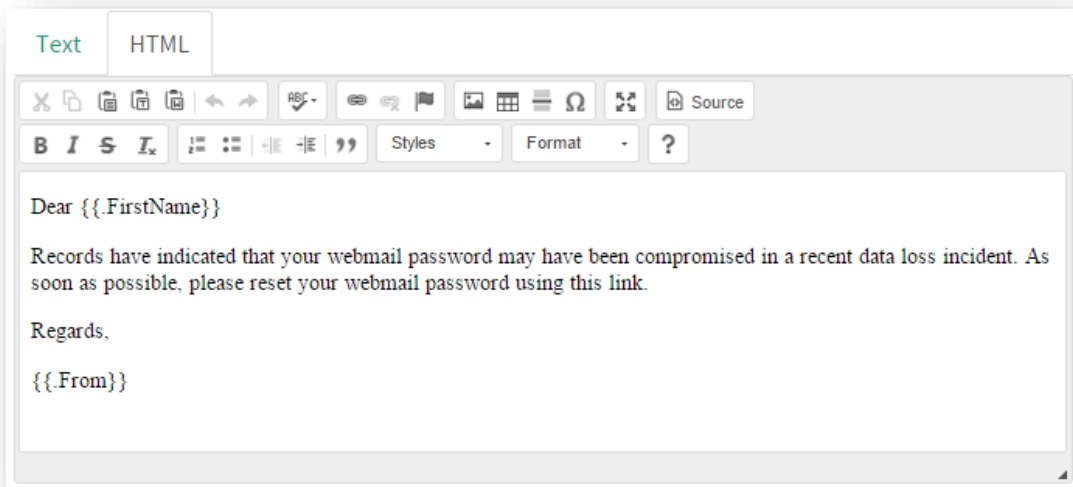

Figure 10 - HTML Editor with Content

The last thing we’ll want to do with the template text is to add a link to our landing page. By highlighting “link” and clicking the hyperlink button (middle button in the top row), we see the following dialog appear:

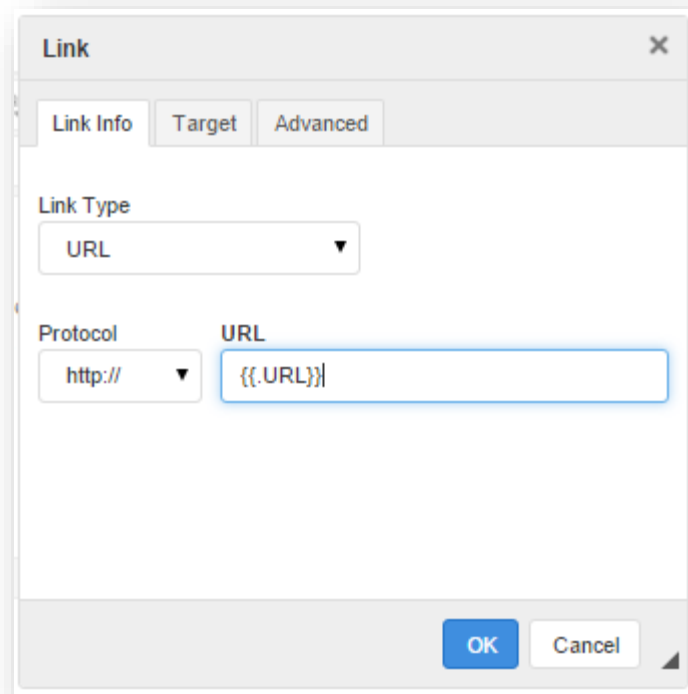

Figure 11 - Hyperlink Editor

Then, we click OK to exit the dialog.

After we setup the email content, we can attach files if desired. This is helpful if you want to create an attachment that simulates a malware infection. In fact, it should be possible to create attachments that will update the gophish campaign if the attachment is open, giving insight into which users are susceptible to opening malicious files.

Finally, we need to save our template by clicking the “Save Changes” button.

---

*If you don't see the template show up right away after clicking “Save Changes”, refresh the page and it should appear in the table.*

---

## Creating a Landing Page

Landing pages are the actual HTML pages that are returned to the users when they click the phishing links they receive.

To create a landing page, navigate to the “Landing Pages” page and click the “New Page” button.

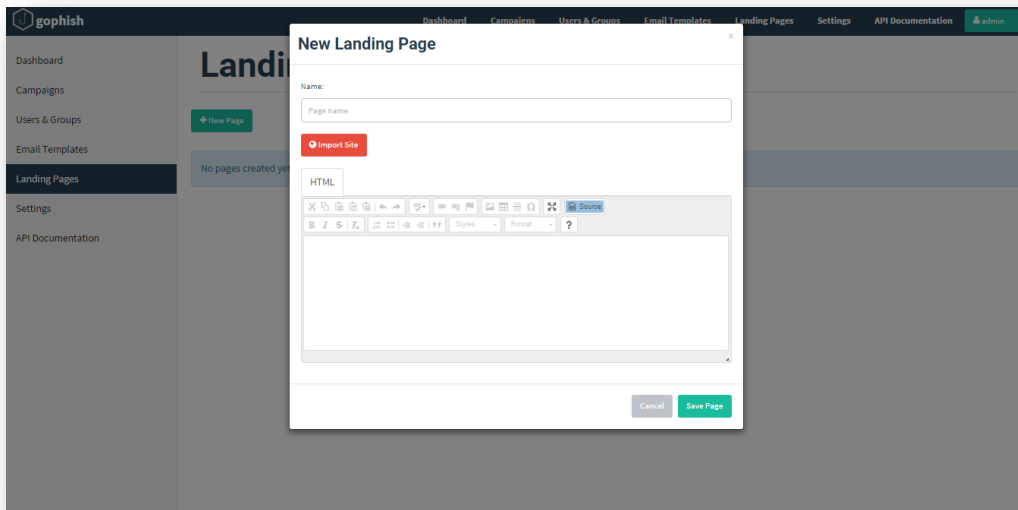

Figure 12 - Create a Landing Page

On this page, we have the ability to set the name of our landing page, as well as creating the content. The content is HTML code that can either be created from scratch, or imported from a URL to clone an existing website.

As a security administrator, you might normally want to set this to a page to training documentation indicating that the user was a victim of simulated phishing, as well as steps the user can take to identify and report phishing attempts in the future.

For our scenario, we will do something a bit different.

We know that our company, Morning Catch, has a webmail login page at <http://morningcatch.dev/mail>. It looks similar to this:

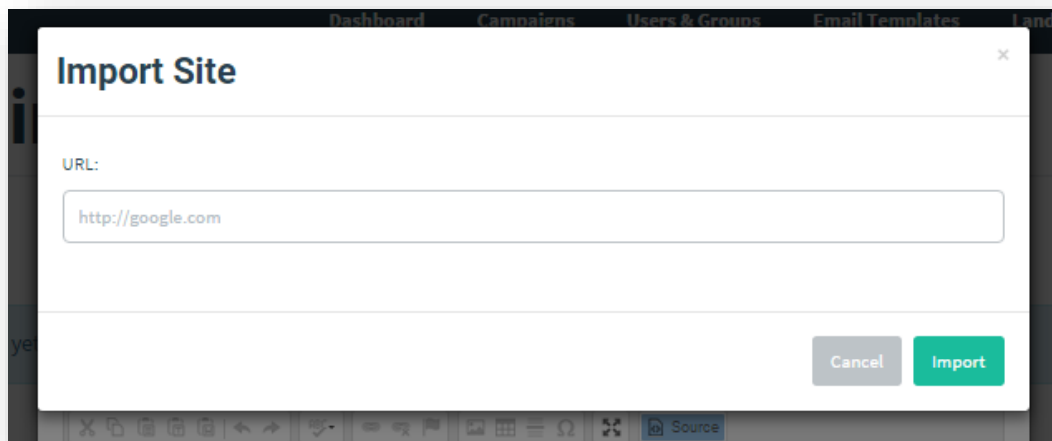

Figure 13 - Morning Catch Webmail Login

Let's use gophish to import this landing page directly. By clicking the "Import Site" button, we are presented with the following screen:

*Figure 14 - Importing a Site*

If we put the webmail URL into the "URL" field and click the "Import" button, we will see gophish go out to the site and pull down the HTML. Then, we are navigated back to our previous screen, where we can see and edit the imported site.

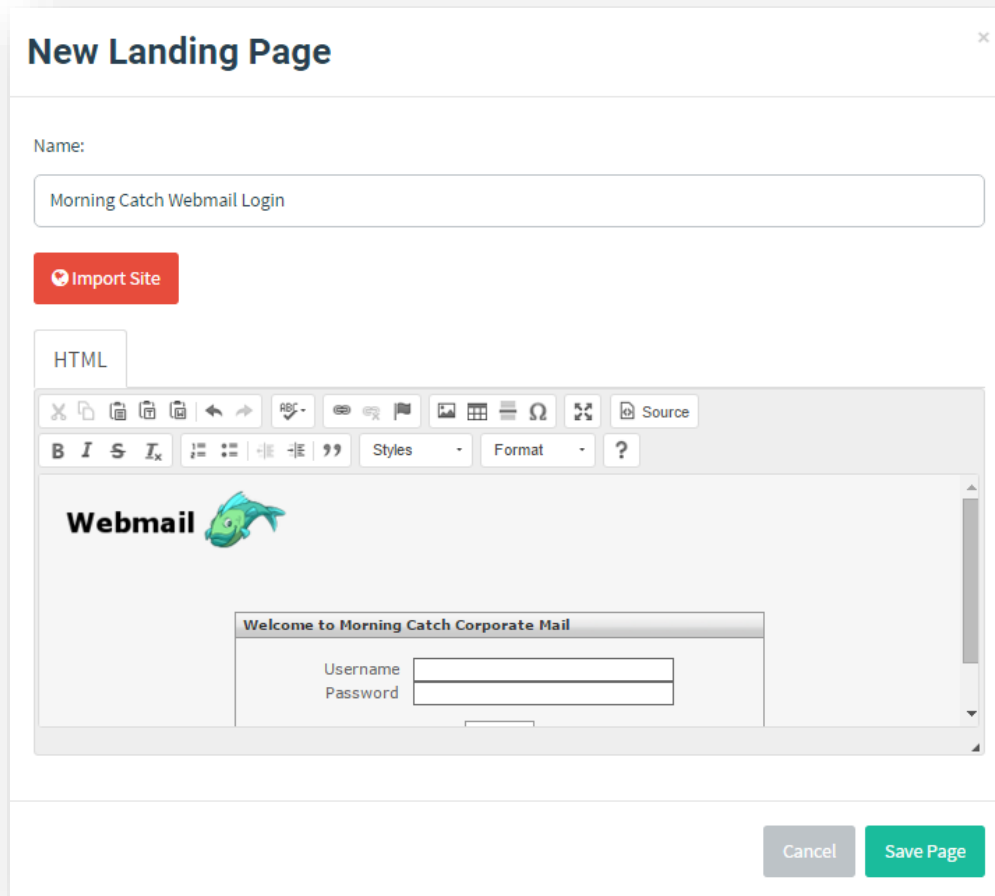

Figure 15 - Importing the Morning Catch Webmail Login

I'm sure you're wondering "how do we get the usernames/passwords submitted by the user?" Currently, gophish doesn't support credential harvesting, but it is a feature that will be coming out in the very next release, so *stay tuned!*

For now, you will be able to know if the user visits the site, which will give you an indication that the user is susceptible to clicking unknown links in emails.

---

*If you don't see the landing page show up right away after clicking "Save Changes", refresh the page and it should appear in the table.*

---

## Creating a Campaign

The last thing we need to setup is the campaign itself. To setup a campaign, first navigate to the "Campaigns" page and click the "New Campaign" button:

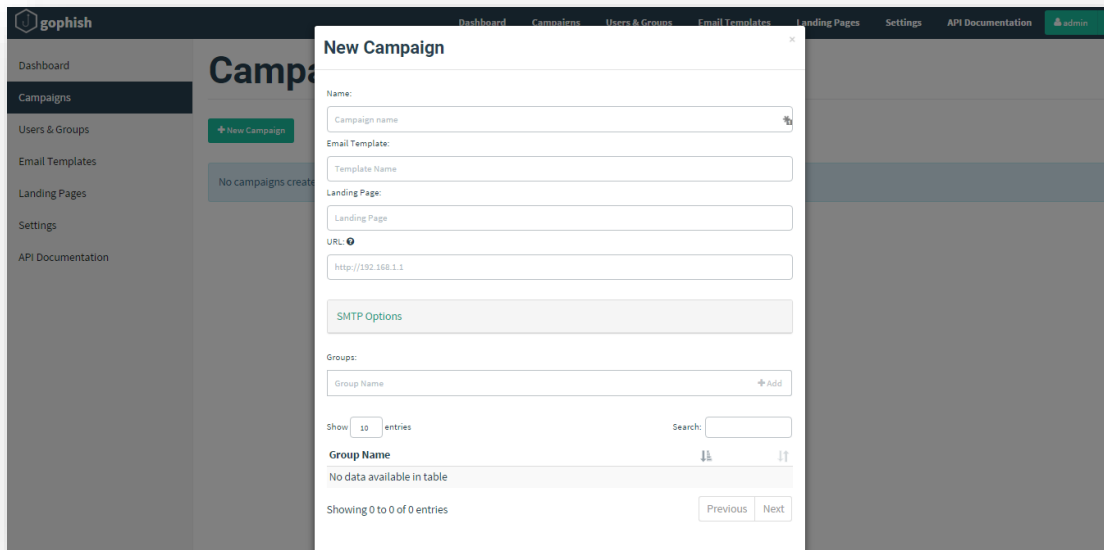

Figure 16 - Creating a New Campaign

We start by setting the campaign name, email template, and landing page we want to use. Gophish makes this easy by providing autocomplete functionality when we are setting the template and landing pages.

Next, we need to set the URL that the users will be directed to. This need to be the IP address of the gophish host (and port!) **that is reachable by the users**. This means that if you are only targeting internal users, you would probably be fine using the host's internal IP address. However, if your targets are coming in externally, you will need to setup gophish to be reachable externally and set this field to be the external (public) IP address.

It is important to note that you can also use a domain name if the domain resolves to the correct IP address for the gophish listener!

Next, we expand the SMTP options and are presented with the following:

The image shows a web form titled "SMTP Options". It contains four input fields, each with a label and a value:

- From:** First Last <test@example.com>
- Host:** smtp.example.com:25
- Username:** Username
- Password:** Password

Each input field has a small trash icon on the right side, indicating that the content can be cleared or deleted.

Figure 17 - SMTP Options

The first field we fill out is the “From” field. This field describes who the email will appear to have been sent from. In our example, let’s spoof the user “System Administrator <sysadmin@morningcatch.ph>”.

The rest of the SMTP options should be set according to the settings in use by your organization, or to an open relay. For our cases, we know that Morning Catch’s SMTP server is at smtp.morningcatch.dev and TCP port 25, and we know that we do not need to authenticate, so we can leave the username/password blank.

Finally, we just need to choose what groups we want to include in this campaign. Gophish’s autocomplete functionality will help make this easy. It’s important to note that, after selecting the group you want to add, you must click enter to actually add it to the list of groups. It should look like this:

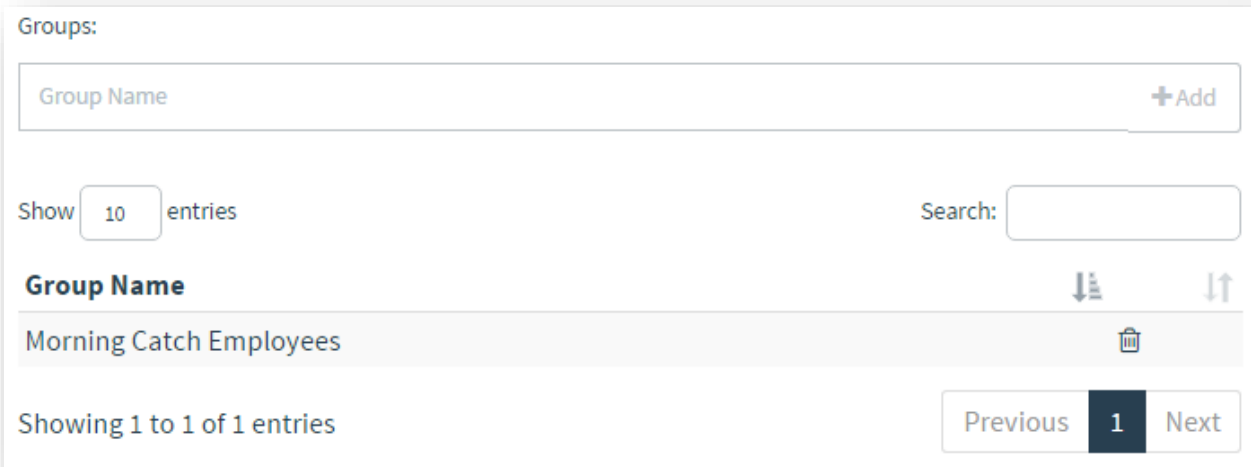

Figure 18 - Adding a Group to a Campaign

That's it! Once we click "Save Changes", our campaign will be launched automatically and emails will be sent to the targets.

---

*If you don't see the campaign show up right away after clicking "Save Changes", refresh the page and it should appear in the table.*

---

By refreshing the page, we should see our campaign listed as "In Progress":

Figure 19 - In Progress Campaign

## Viewing Campaign Results

Now let's take a look at how we can track results from a campaign.

We can access our campaign from a couple of places – the "Dashboard", or the "Campaigns" page. By clicking the "View" button for our campaign (green button), we see the following overview stats:

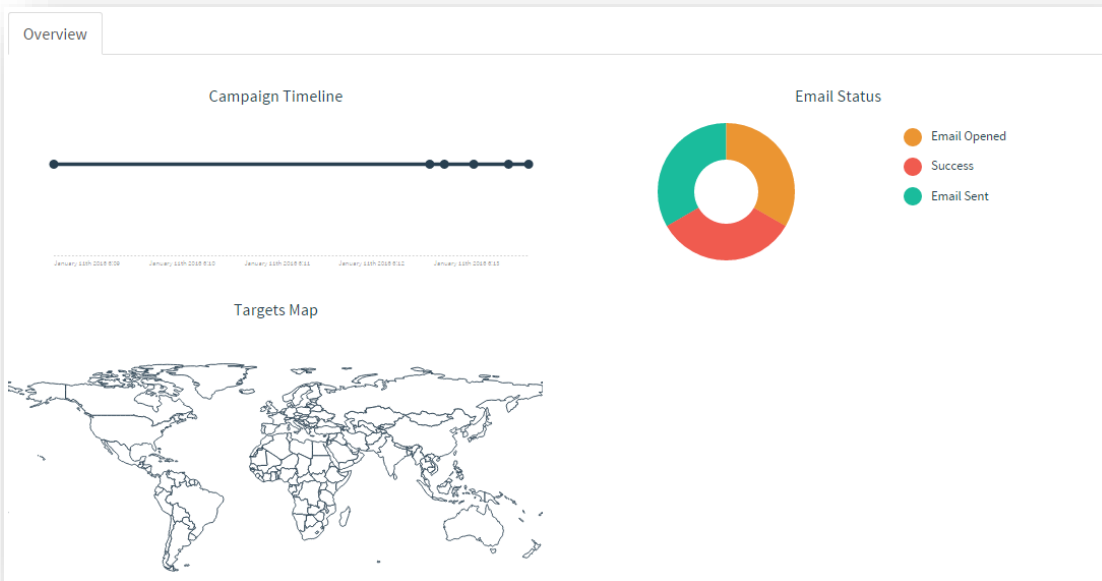

Figure 20 - Overview Results

It looks like in our scenario, we had 2 out of the 3 users open the email, and one user clicked the link. We can see the detailed statistics at the bottom of the page:

## Details

Show  entries Search:

First Name	Last Name	Email	Position	Status
Boyd	Jenius	bjenius@morningcatch.ph		Email Opened
Haiti	Moreo	hmoreo@morningcatch.ph		Success
Richard	Bourne	rbourne@morningcatch.ph		Email Sent

Showing 1 to 3 of 3 entries Previous **1** Next

Figure 21 - Campaign Details

Looks like we had a successful campaign, and have found areas where training can be provided!

## Appendix

### Template Variable Reference

The following variables are available to be used in templates and landing pages:

---

*Tip:*

*Remember – Templates are **case sensitive!***

---

Variable	Description
{{.FirstName}}	The target's first name
{{.LastName}}	The target's last name
{{.Position}}	The target's position
{{.From}}	The spoofed sender
{{.TrackingURL}}	The URL to the tracking handler
{{.Tracker}}	An alias for <code>&lt;img src="{{.TrackingUrl}}"/&gt;</code>
{{.URL}}	The phishing URL
